

Wordpress Implementation - Part 2

Once the required php files have been uploaded to the web server, additional php code must be added to WordPress to enable the queuing functionality. The code is accessed via PBR's private GitHub repository at <https://github.com/pbr-it/queue-it>

Credentials are located in the IT password store.

Before adding the code, ensure that the variable `$secretKey` is set to the secret key specified in the Queue-it portal.

The Code Snippets Wordpress plugin is used to add the code to Wordpress.

After opening the plug in, create a new snippet.

Add the code to the code preview window, ensuring that 'Code Type is set to PHP Snippet'

A screenshot of a dropdown menu labeled 'Code Type'. The selected option is 'PHP Snippet', indicated by a downward arrow on the right side of the menu.

Ensure that the insertion options are the same as below. Selecting 'Frontend Conditional Logic' ensures that the code is only executed by visitors and not when attempting to edit the page.

A screenshot of the 'Insertion' settings panel in the Code Snippets plugin. The panel includes a help icon, a note about 'Auto Insert' and 'Shortcode' modes, and several configuration options:

- Insert Method:** Two buttons are shown: 'Auto Insert' (selected with a blue border) and '[/] Shortcode'.
- Location:** A dropdown menu is set to 'Frontend Conditional Logic'.
- Schedule snippet:** A section with a 'PRO' badge containing 'Start Date' and 'End Date' input fields, and a help icon.

Under 'Smart Conditional Logic', specify the criteria that should apply for the code to run,

Smart Conditional Logic ?

Using conditional logic you can limit the pages where you want the snippet to be auto-inserted.

Enable Logic

Conditions

Show ▼ This code snippet if

Page URL ▼ Contains ▼ polar-express ⊖

AND

+ Add new group

Save the code snippet.

At this point the code is in place to make the call to Queue-it at page load.

Remaining configuration is performed via the Queue-it portal.
